every chemist of eminence in France and Germany and that his language toward others in his published papers is of the most unjustifiable character. He has recently for instance publicly styled the 2 French chemists Laurent & Gerhardt "highway robbers" and "liars" and of all every one who ventures to differ from him in the most unscrupulous manner. Kolbe the celebrated Dutch chemist has just written a pamphlet in reply to and against Liebig which places the latter in a most unfavourable light before the world. You will probably see it in English. Of Liebig's talents there can be no doubt however and Giessen is not a bad school for one who has learnt accuracy and careful manipulation elsewhere. It is a great advantage to be where so many are at work but's mind gets well stirred up, one converses continually on scientific subjects and during those little intervals which so often occur in one's work in the laboratory, while something is evaporating or filtering, one may be finding out what others are doing and how they do it and so pick up many small scraps of experience. The professors in the laboratory are kind and attentive and on Saturday and Sunday afternoons we take long walks together and discourse upon all chemical subjects or topics at great length in both English and German. Giessen is situated in rather a pleasant country and there are some pleasant walks in the neighbourhood though the season is growing rather late, and I do not intend remaining more than one quarter here as the laboratory expenses are rather heavy and I can learn everything that I require in less than that time. We are provided with nothing but charcoal and the commonest reagents and are compelled to find ourselves in glass, corks, copper chromate of lead &c. &c. This amounts to considerable at the end of the session and although everything is 75 per cent cheaper than with us. There is some little society in Giessen among the professor's families but I do not go into it at all first because all German society is horribly dull and secondly because I only came here to study, and study I accordingly must. So much for Giessen just now. Hereafter I may have more to tell you about it. Now about yourself. In the first place I sent the books long since to Loiseleurs and to Rouge. From the first I have received an answer containing a letter to you which I should copy off on the top of the next page to make it more legible. From Rouge I have no news as yet though the books went long ago. I shall

I found your last letter awaiting for me here but had not time to answer it by last steamer as I intended and that George I should do. Your western tour interested me very much and I am glad you are so well after it. You tell me you are well and fleshy and I can only say in return that I am well though looking fleshy. Kind love

Loiseleurs —
