Corrections to Geological report.

In "Cedar & Cypress" substitute wherever ~~it~~ may occur "Arbor vitae"

In speaking of the Cascade range as seen at Chequoi, after the words "chain of hills of a very equal height", add "rising from an elevated plateau."

At the time when the heights of the peaks of Cascade are mentioned, add: "The height of Mt Rainier as given by Wilkes is 12,330 feet, ~~that~~ and that of Mt Helens 9,550, ~~the height of Mt Adams is apparently the last is about that~~ from which last ~~the~~ that Adams does not apparently vary much."

Wherever or where the positions of the Craters are given, state "The crater of Mt Rainier is supposed from the general form of the mountain to have been at the summit, where it presents three points or knobs, enclosing a basin."

Speaking of the Sahpeen, after the words "its bed through a very deep cañon is much more elevated", add "than that of the Klikatat".

Speaking of the Geological structure of the Cascade range strike out the words "Lieutenant Wilkes mentions that in the Nahchess pass the rocks are trachytic" and insert instead "The rocky bluffs which border the Nahchess from its source down consist of basalt & basaltic conglomerate, and the latter ~~together~~ crosses the range & is visible upon the sides of La Tete, near the western gate of the Nahchess pass. Capt Wilkes mentions that on the summit of this pass the rocks are trachytic & contain black chrystals, probably hornblende"
